Prepared By: Dr. Anil B. Gavade

Element of Image Analysis

Preprocess

Image acquisition, restoration, and enhancement

Intermediate process

Image segmentation and feature extraction

High level process

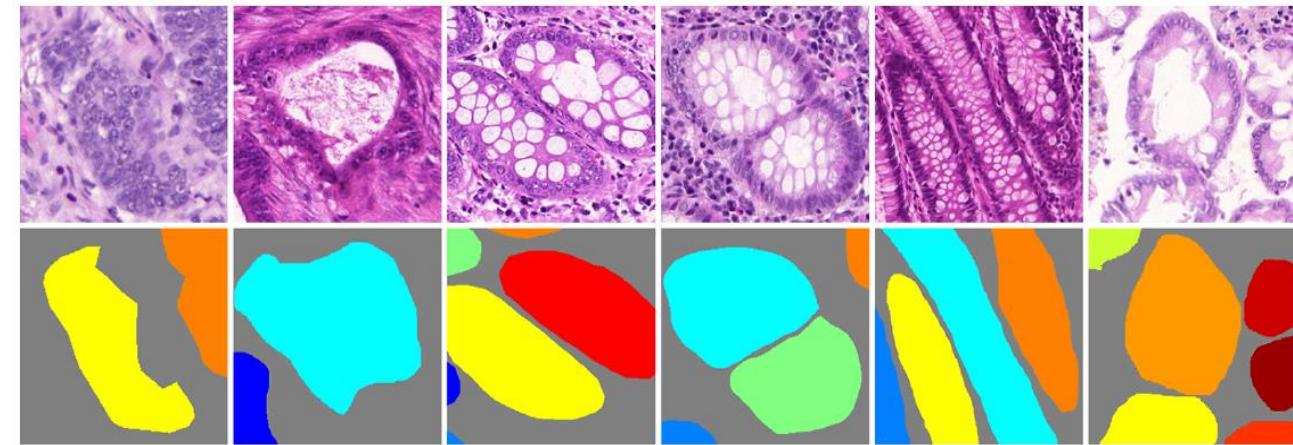

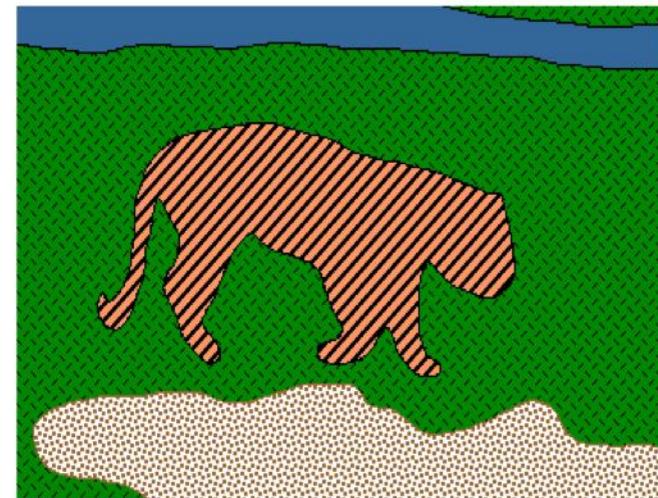

Image interpretation and recognition

Digital image segmentation

Digital image segmentation in computer vision involves dividing an image into segments or regions based on specific criteria. This simplifies image representation, aiding analysis and information extraction. Segmentation is vital in computer vision for tasks like object recognition, image editing, medical imaging, and autonomous vehicles.

Image segmentation involves breaking down a digital image into various subgroups called image segments.

Digital image segmentation

Operators - Filters for Edge and Line Detection

Importance of Image Segmentation

Image segmentation is used to separate an image into constituent parts based on some image attributes. **Image segmentation is an important step in image analysis**

Benefit

1. Image segmentation **reduces huge amount of unnecessary data** while retaining only importance data for image analysis _
2. Image segmentation converts bitmap data into **better structured data which is easier to be interpreted**

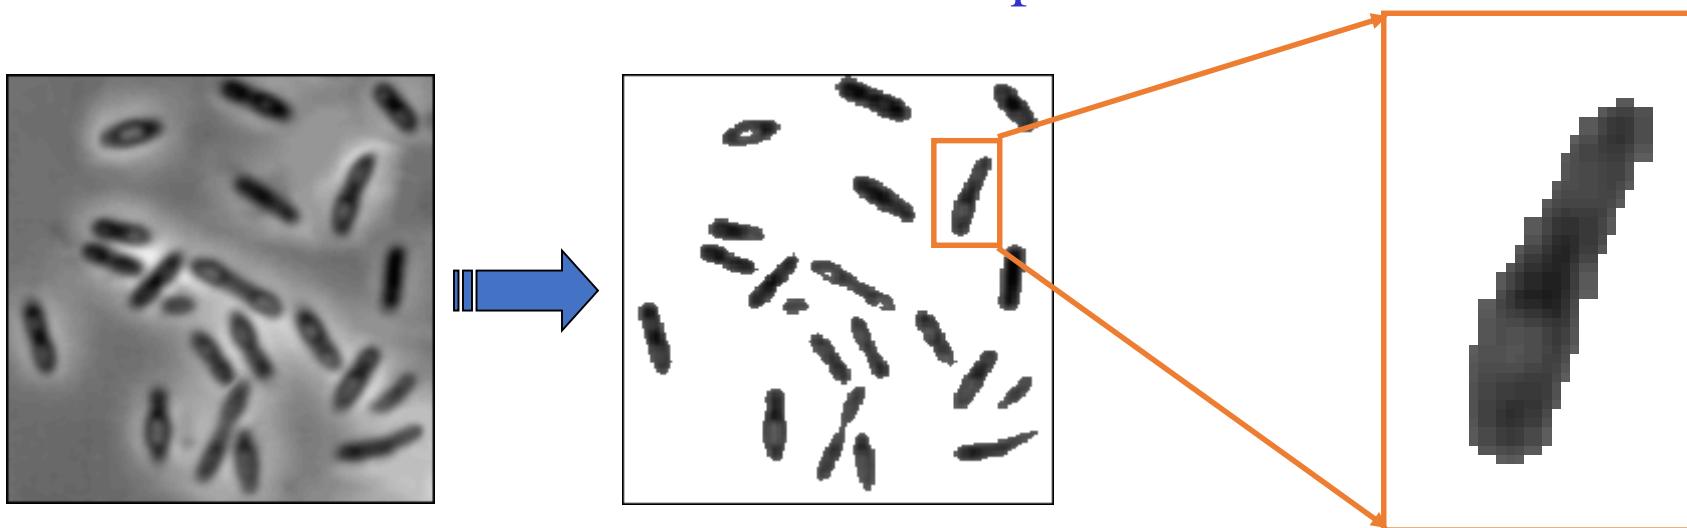

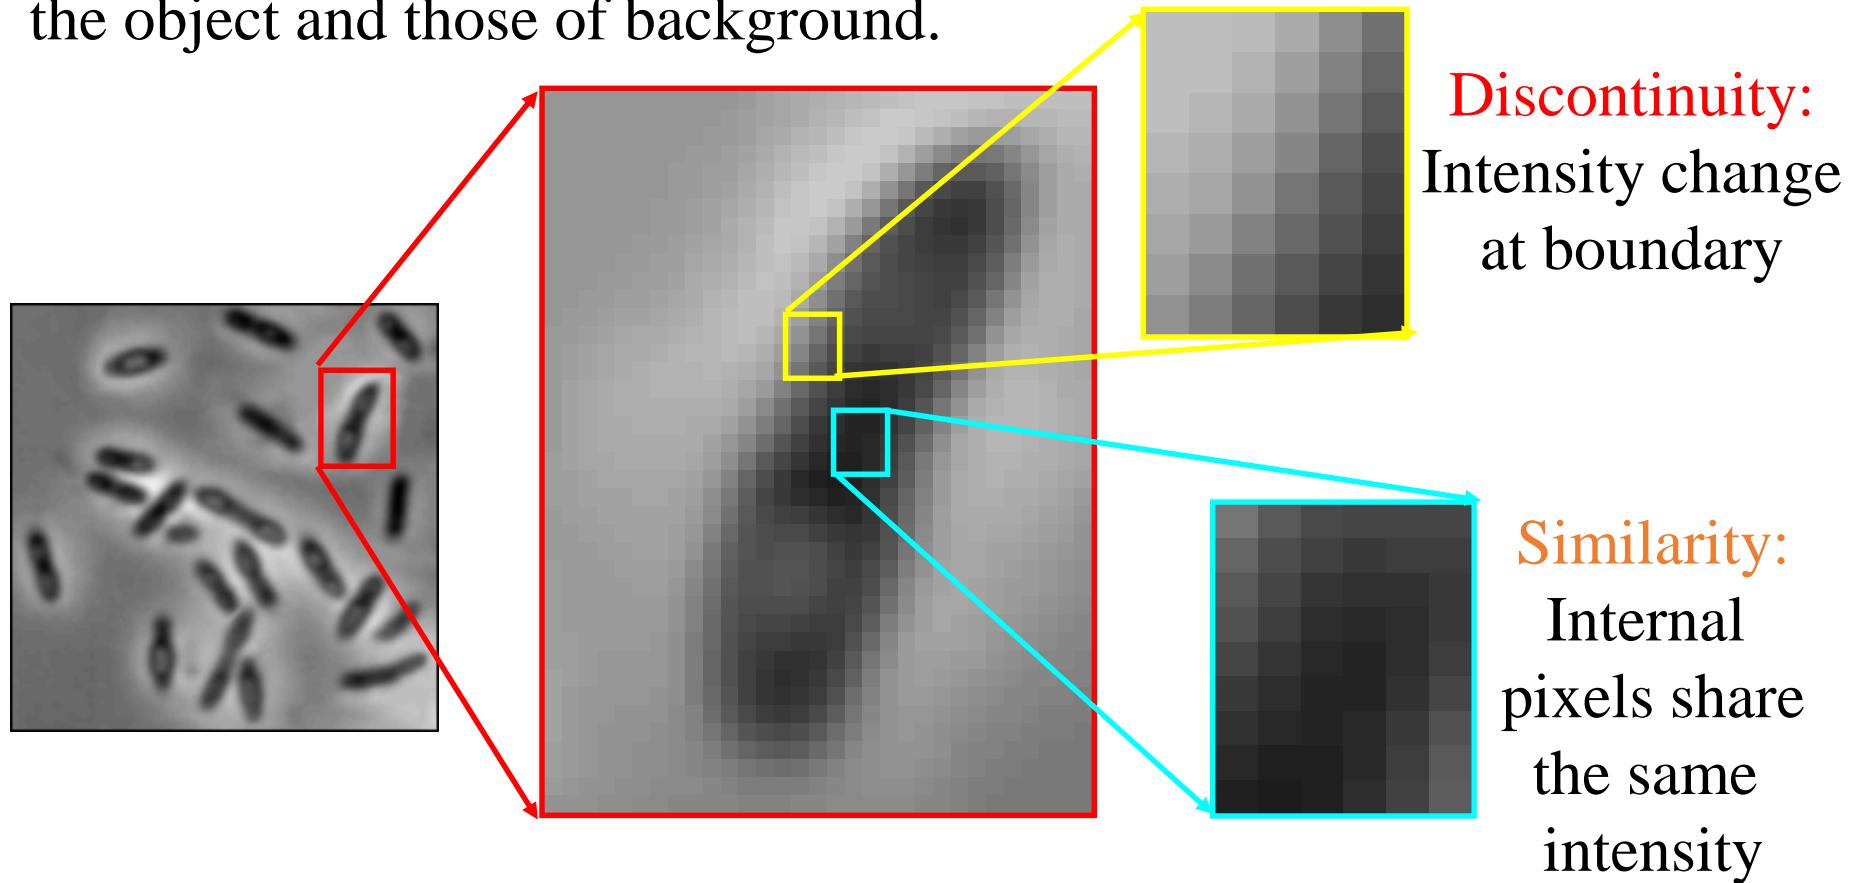

Image Attributes for Image Segmentation

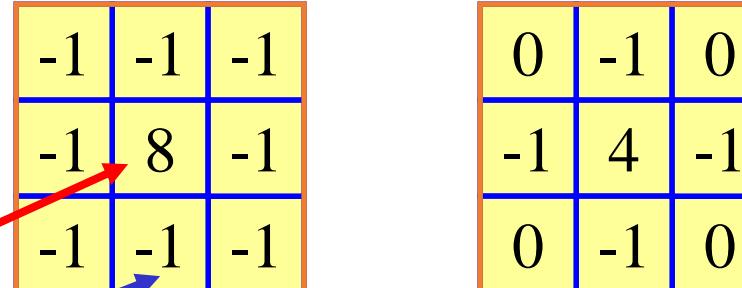

1. **Similarity properties** of pixels inside the object are used to group pixels into the same set.
2. **Discontinuity of pixel properties** at the boundary between object and background is used to distinguish between pixels belonging to the object and those of background.

Spatial Filtering Application to Shape Detection

- ❖ One application of spatial filtering is shape detection: **finding locations of objects with the desired shape.**
- ❖ Unlike frequency selective masks that are designed based on the concept of frequency, **shape detection masks are derived from the shapes to be detected themselves.**
- ❖ A mask for shape detection usually contains the shape or a part of the shape to be detected.
- ❖ The location that is most correlated to the mask is the location where **the highest filter response occurs**. The shape is most likely to exist there.

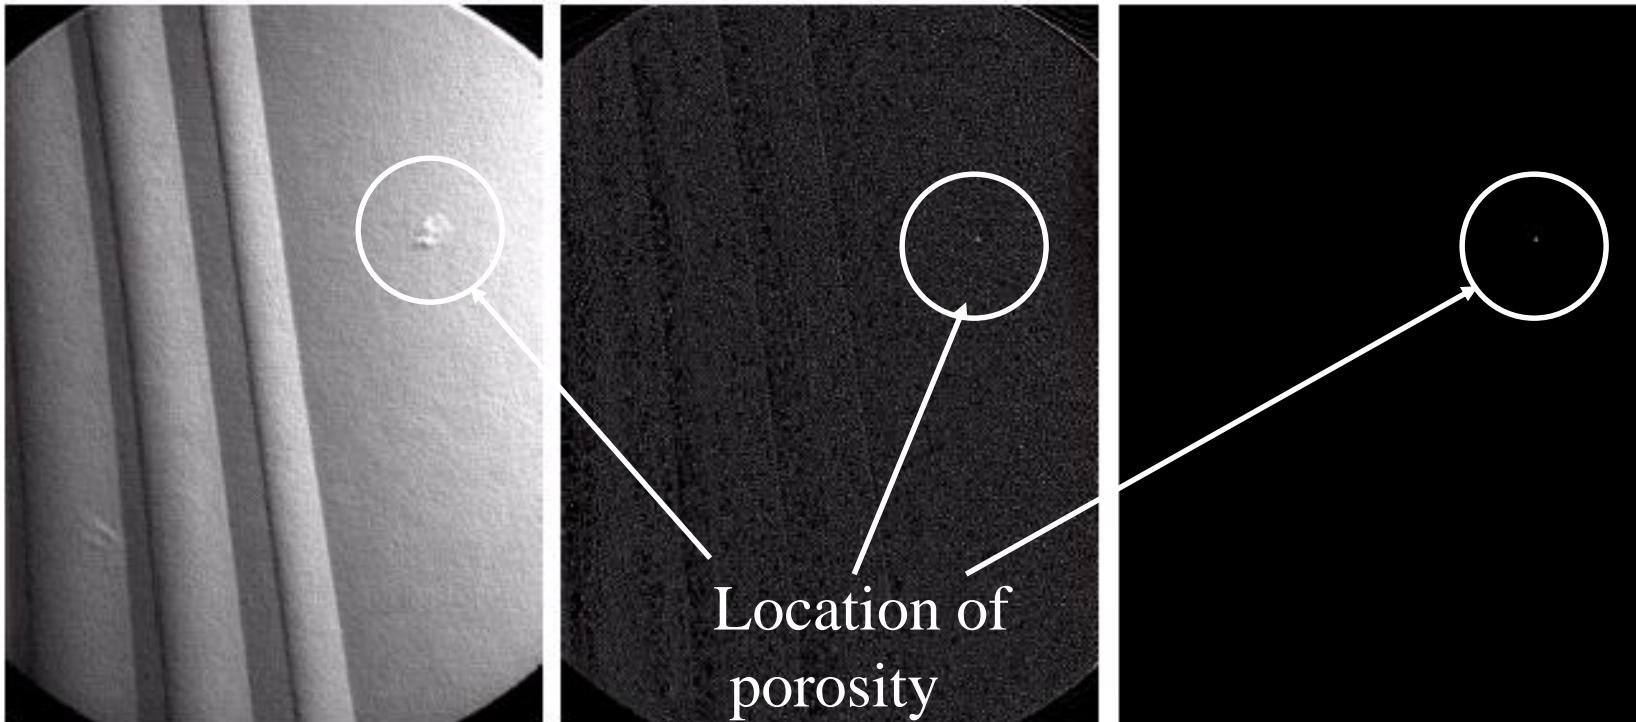

Point Detection

- ❖ We can use Laplacian masks for point detection.
- ❖ Laplacian masks have **the largest coefficient at the center of the mask** while **neighbor pixels have an opposite sign**.
- ❖ This mask will give the **high response** to the object that has the **similar shape** as the mask such as isolated points.
- ❖ Notice that **sum of all coefficients of the mask is equal to zero**. This is due to the need that **the response of the filter must be zero inside a constant intensity area**

Point Detection

Point detection can be done by applying the thresholding function:

$$g(x, y) = \begin{cases} 1 & |\nabla f(x, y)| \geq T \\ 0 & \text{otherwise} \end{cases}$$

X-ray image of the
turbine blade with
porosity

Laplacian image

After thresholding

Line Detection

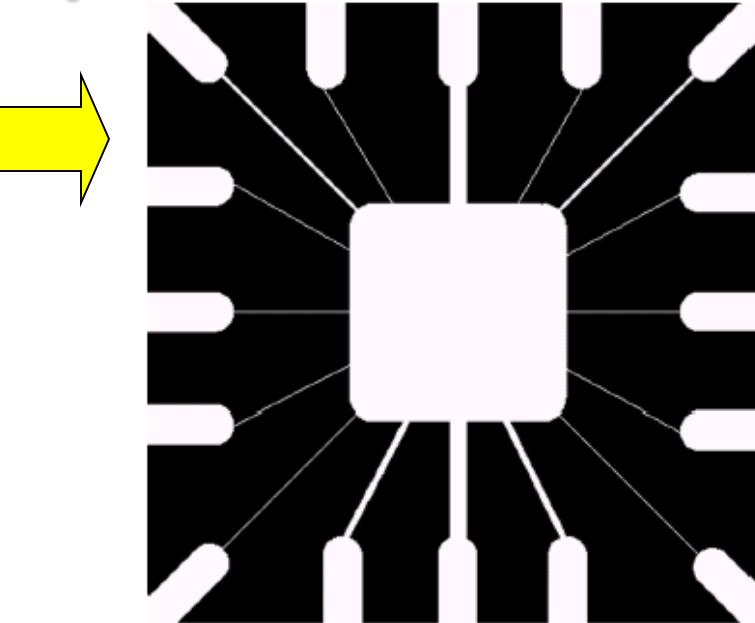

- ❖ Similar to point detection, line detection can be performed using the mask the has the shape look similar to a part of a line
- ❖ There are several directions that the line in a digital image can be.
- ❖ For a simple line detection, 4 directions that are mostly used are Horizontal, $+45^\circ$ degree, vertical and -45° degree.

<table border="1"><tr><td>-1</td><td>-1</td><td>-1</td></tr><tr><td>2</td><td>2</td><td>2</td></tr><tr><td>-1</td><td>-1</td><td>-1</td></tr></table>	-1	-1	-1	2	2	2	-1	-1	-1	<table border="1"><tr><td>-1</td><td>-1</td><td>2</td></tr><tr><td>-1</td><td>2</td><td>-1</td></tr><tr><td>2</td><td>-1</td><td>-1</td></tr></table>	-1	-1	2	-1	2	-1	2	-1	-1	<table border="1"><tr><td>-1</td><td>2</td><td>-1</td></tr><tr><td>-1</td><td>2</td><td>-1</td></tr><tr><td>-1</td><td>2</td><td>-1</td></tr></table>	-1	2	-1	-1	2	-1	-1	2	-1	<table border="1"><tr><td>2</td><td>-1</td><td>-1</td></tr><tr><td>-1</td><td>2</td><td>-1</td></tr><tr><td>-1</td><td>-1</td><td>2</td></tr></table>	2	-1	-1	-1	2	-1	-1	-1	2

Processing, 2nd Edition.)

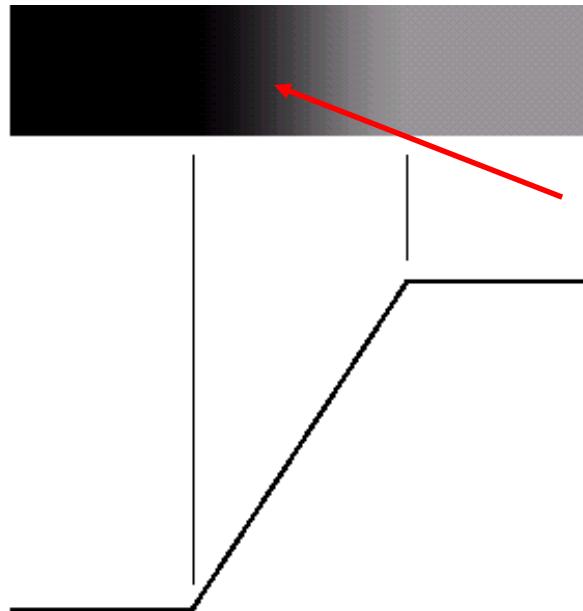

Edges

Ideal step edge

Gray-level profile
of a horizontal line
through the image

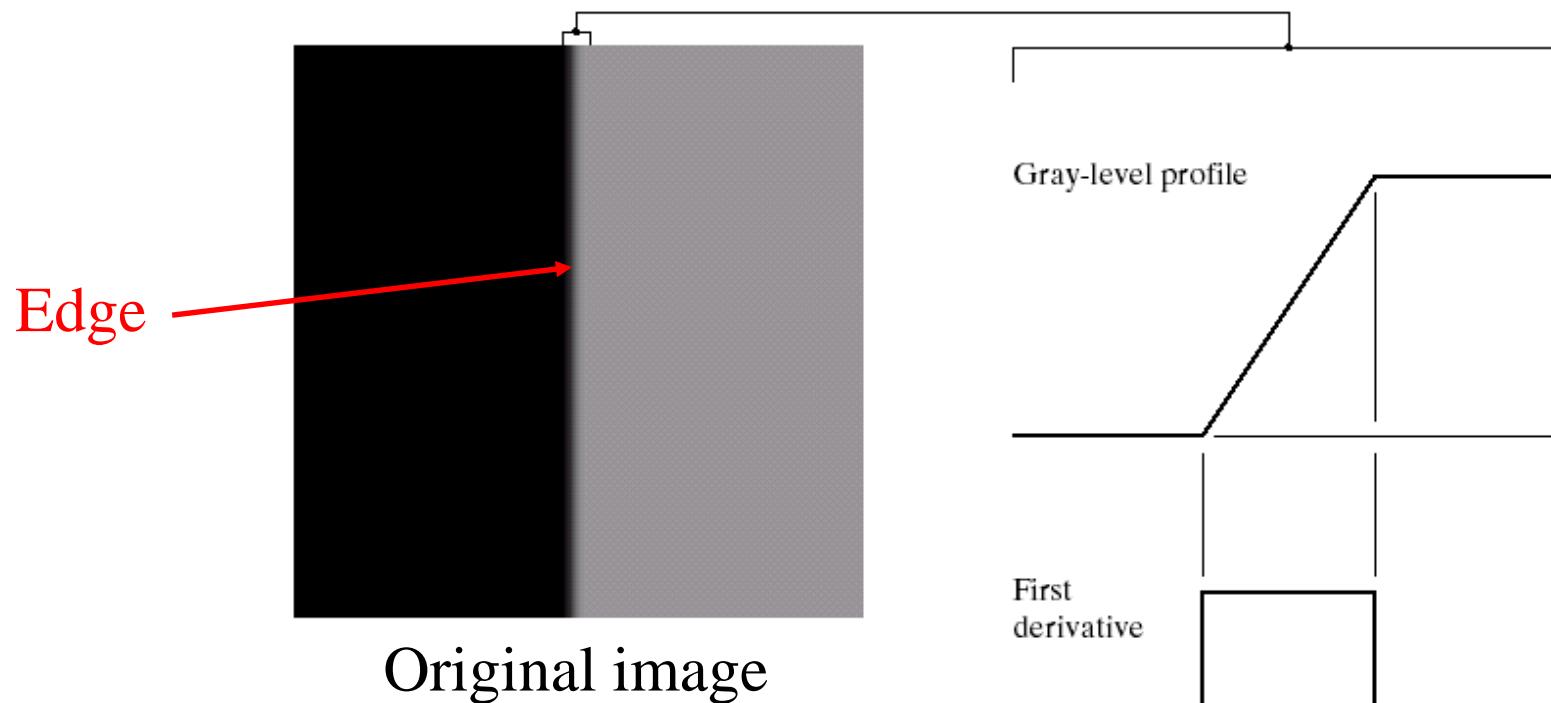

Ideal ramp edge

Gray-level profile
of a horizontal line
through the image

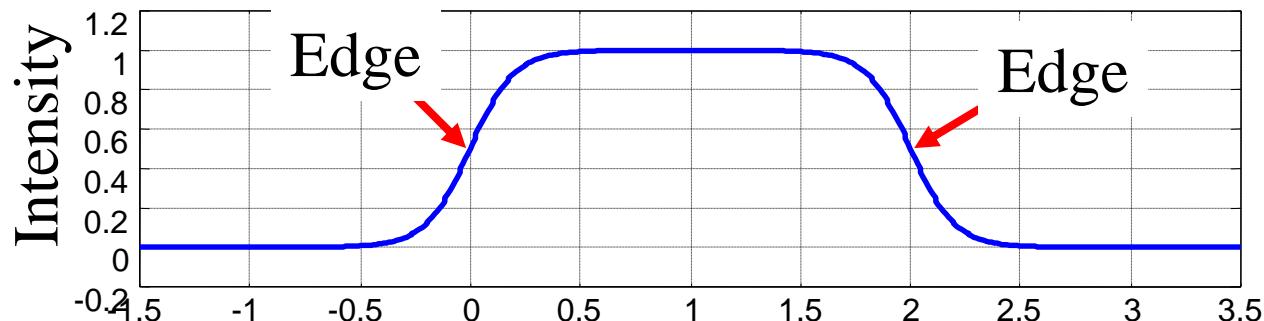

Generally, objects and background have different intensities. Therefore,
Edges of the objects are the areas where abrupt intensity changes occur.

Ideal Ramp Edges and its Derivatives

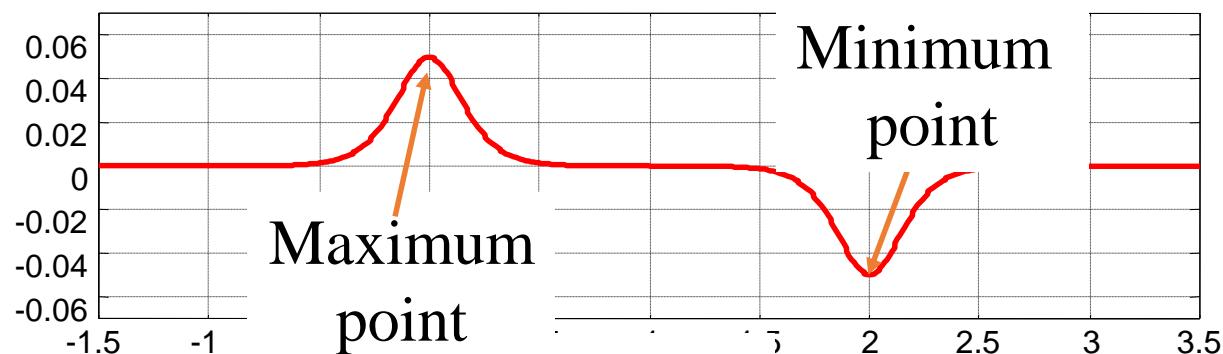

Smoothed Step Edge and Its Derivatives

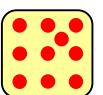

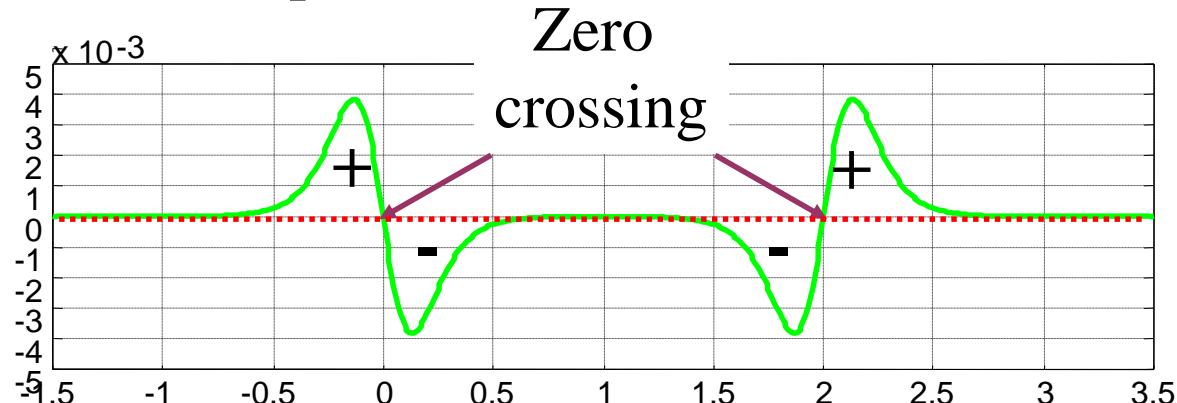

Gray level profile

The 1st derivative

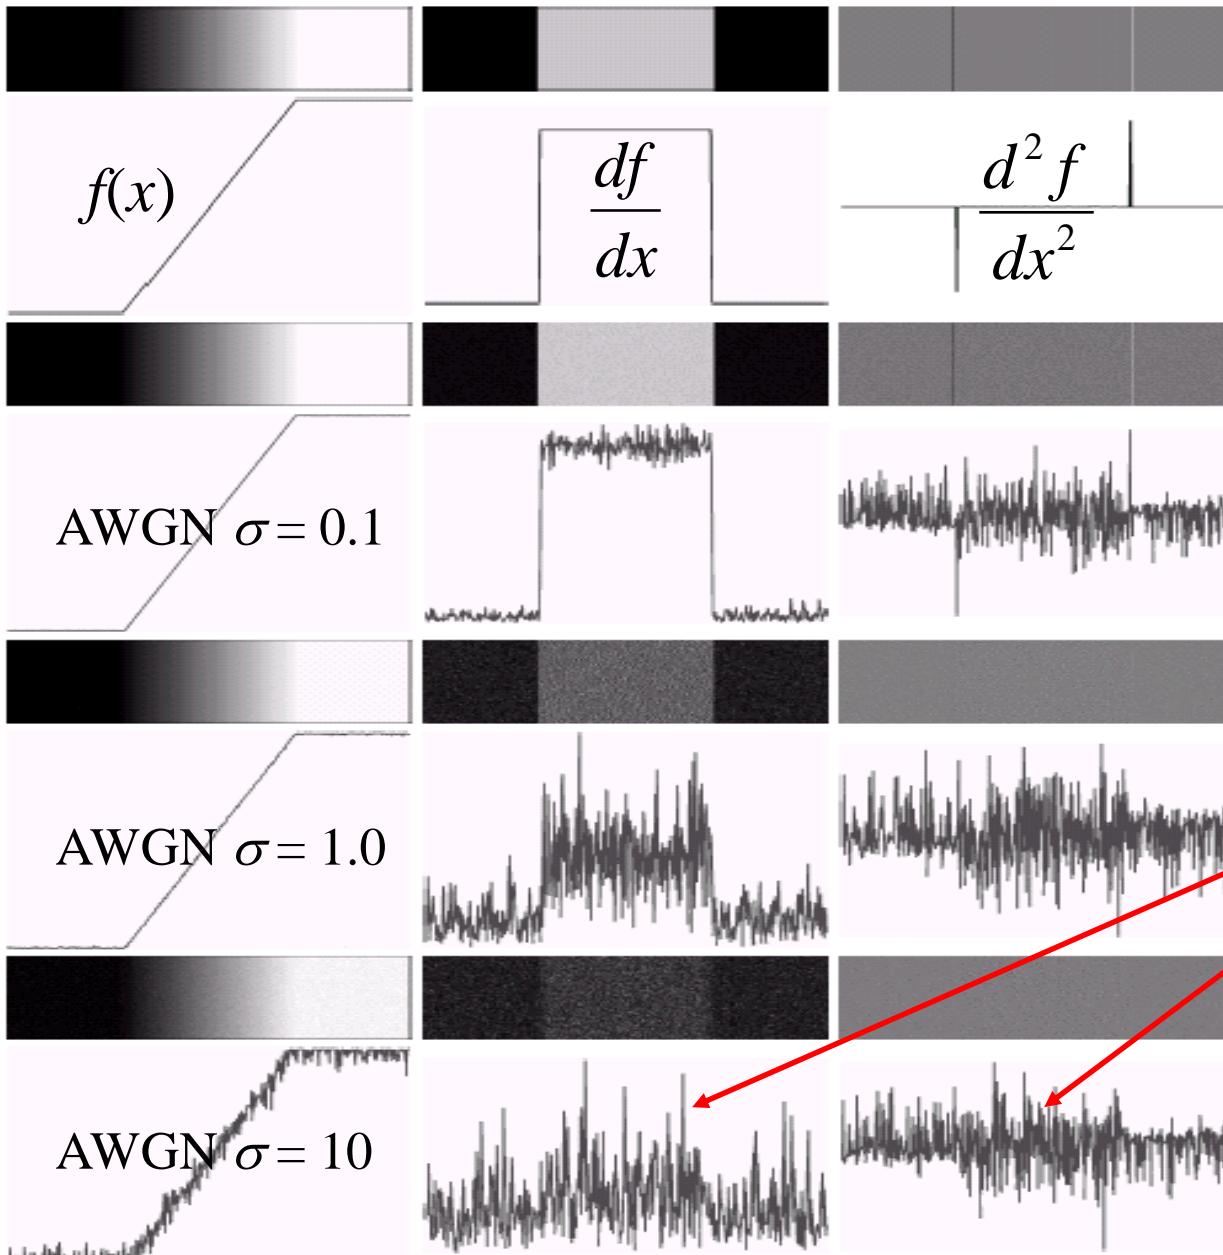

The 2nd derivative

Derivative Based Edge Detection

- ❖ From the previous slide, we can conclude that:
Local maxima of the absolute of the 1st derivative and Zero crossing
of the 2nd derivative occur at edges.
- ❖ Therefore, for detecting edges, we can apply zero crossing detection
to the 2nd derivative image or thresholding the absolute of the
1st derivative image.
- ❖ Nevertheless, derivative operator is very sensitive to noise as we
will see in the next slide.

Noisy Edges and Derivatives

Derivative operator is a highpass filter and thus enhances noise.

Edge responses are buried by noise.

Masks for Estimating Partial Derivatives

Normally, the mask for estimating partial derivative is anti-symmetry with respect to the orthogonal axis

<table border="1"><tr><td>-1</td><td>0</td></tr><tr><td>0</td><td>1</td></tr></table>	-1	0	0	1	<table border="1"><tr><td>0</td><td>-1</td></tr><tr><td>1</td><td>0</td></tr></table>	0	-1	1	0										
-1	0																		
0	1																		
0	-1																		
1	0																		
Roberts																			
<table border="1"><tr><td>-1</td><td>-1</td><td>-1</td></tr><tr><td>0</td><td>0</td><td>0</td></tr><tr><td>1</td><td>1</td><td>1</td></tr></table>	-1	-1	-1	0	0	0	1	1	1	<table border="1"><tr><td>-1</td><td>0</td><td>1</td></tr><tr><td>-1</td><td>0</td><td>1</td></tr><tr><td>-1</td><td>0</td><td>1</td></tr></table>	-1	0	1	-1	0	1	-1	0	1
-1	-1	-1																	
0	0	0																	
1	1	1																	
-1	0	1																	
-1	0	1																	
-1	0	1																	
Prewitt																			
<table border="1"><tr><td>-1</td><td>-2</td><td>-1</td></tr><tr><td>0</td><td>0</td><td>0</td></tr><tr><td>1</td><td>2</td><td>1</td></tr></table>	-1	-2	-1	0	0	0	1	2	1	<table border="1"><tr><td>-1</td><td>0</td><td>1</td></tr><tr><td>-2</td><td>0</td><td>2</td></tr><tr><td>-1</td><td>0</td><td>1</td></tr></table>	-1	0	1	-2	0	2	-1	0	1
-1	-2	-1																	
0	0	0																	
1	2	1																	
-1	0	1																	
-2	0	2																	
-1	0	1																	
Sobel																			

For example, the Sobel mask for computing $\frac{\partial f}{\partial x}$ is anti-symmetry with respect to the y-axis. It has the positive sign on the right side and negative sign on the left side.

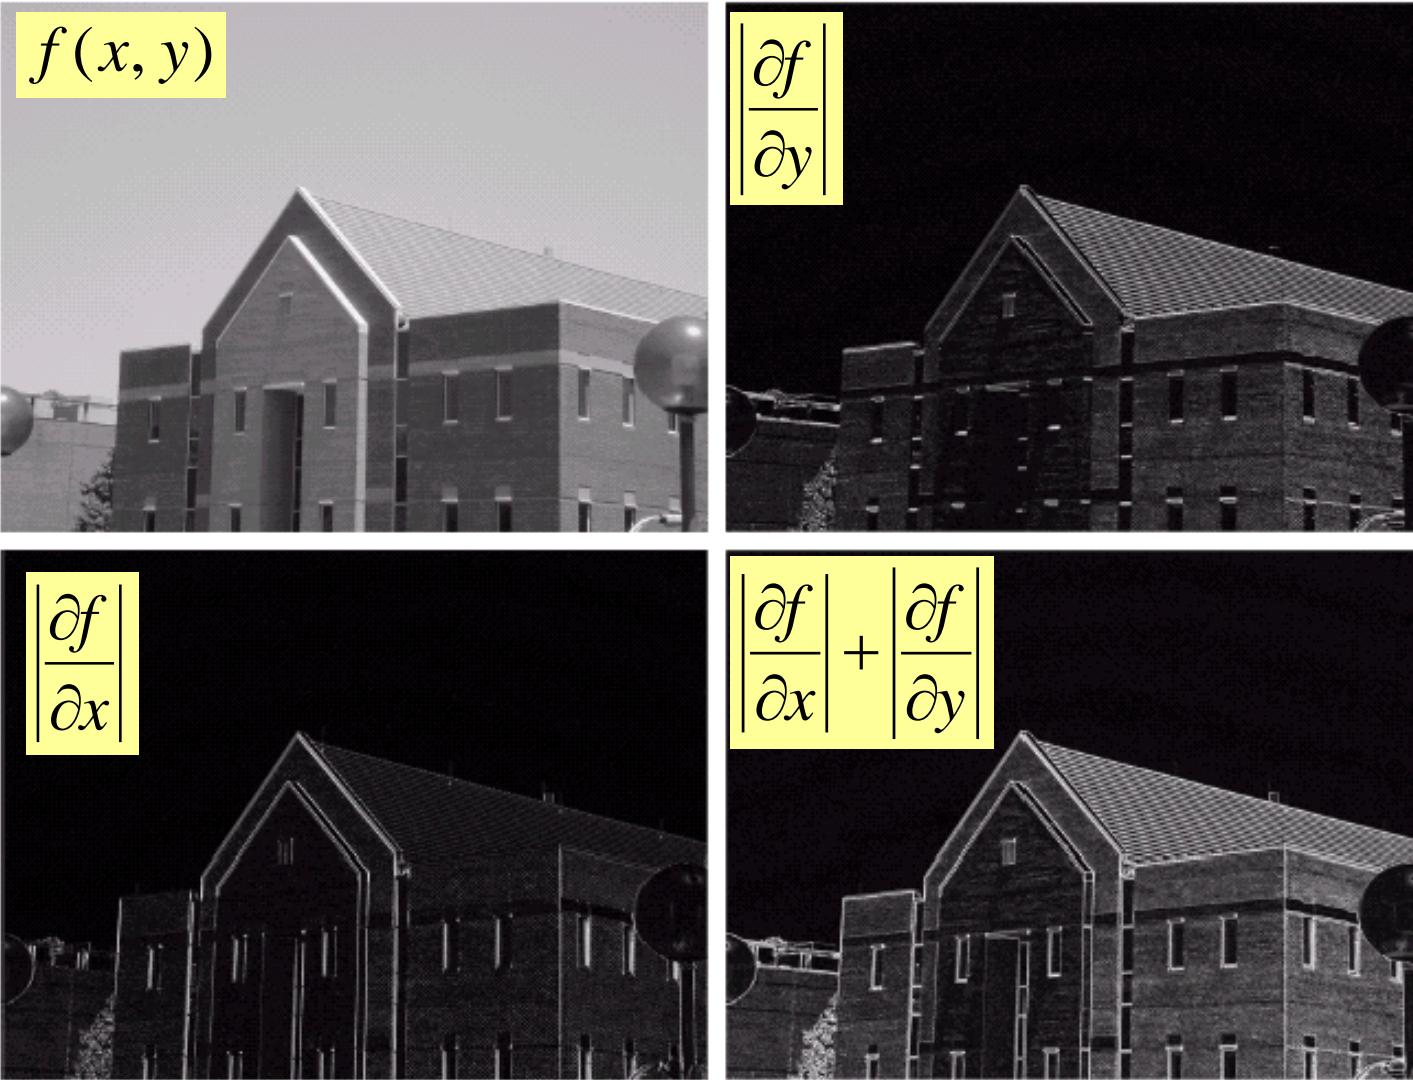

Notice that sum of all coefficients is equal to zero to make sure that the response of a constant intensity area is zero.

Masks for Detecting Diagonal Edges

<table border="1"><tr><td>0</td><td>1</td><td>1</td></tr><tr><td>-1</td><td>0</td><td>1</td></tr><tr><td>-1</td><td>-1</td><td>0</td></tr></table>	0	1	1	-1	0	1	-1	-1	0	<table border="1"><tr><td>-1</td><td>-1</td><td>0</td></tr><tr><td>-1</td><td>0</td><td>1</td></tr><tr><td>0</td><td>1</td><td>1</td></tr></table>	-1	-1	0	-1	0	1	0	1	1
0	1	1																	
-1	0	1																	
-1	-1	0																	
-1	-1	0																	
-1	0	1																	
0	1	1																	
Prewitt																			
<table border="1"><tr><td>0</td><td>1</td><td>2</td></tr><tr><td>-1</td><td>0</td><td>1</td></tr><tr><td>-2</td><td>-1</td><td>0</td></tr></table>	0	1	2	-1	0	1	-2	-1	0	<table border="1"><tr><td>-2</td><td>-1</td><td>0</td></tr><tr><td>-1</td><td>0</td><td>1</td></tr><tr><td>0</td><td>1</td><td>2</td></tr></table>	-2	-1	0	-1	0	1	0	1	2
0	1	2																	
-1	0	1																	
-2	-1	0																	
-2	-1	0																	
-1	0	1																	
0	1	2																	
Sobel																			

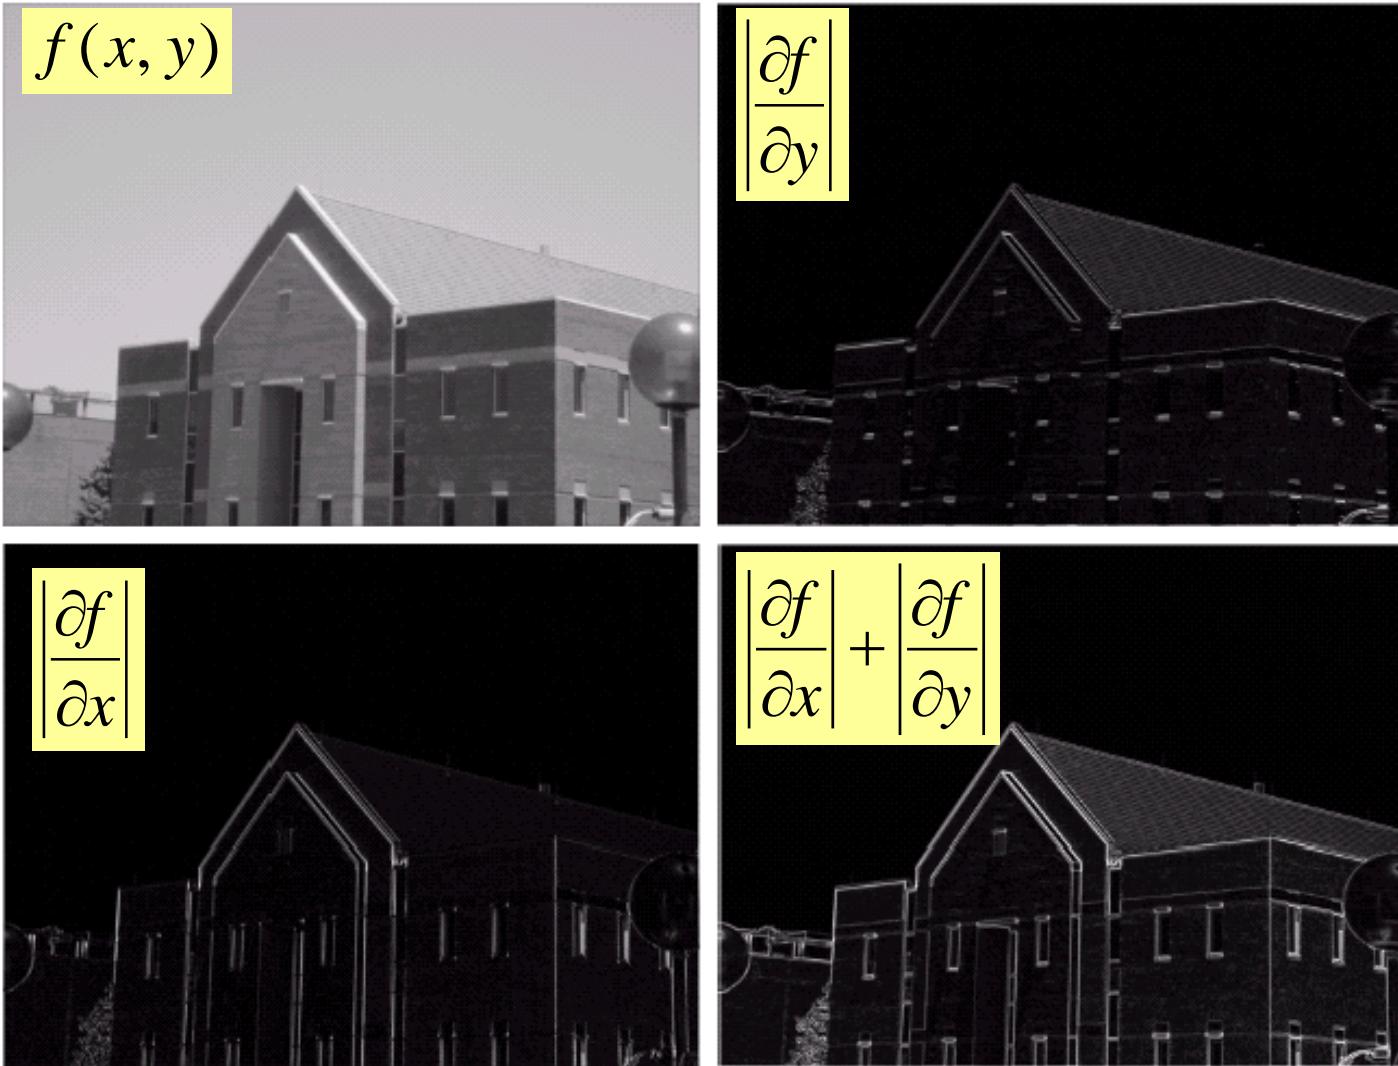

The mask for detecting -45-degree edges is anti-symmetry with respect to the -45-degree lines while the mask for detecting 45-degree edges is anti-symmetry with respect to the 45-degree lines.

Example of Image Gradient

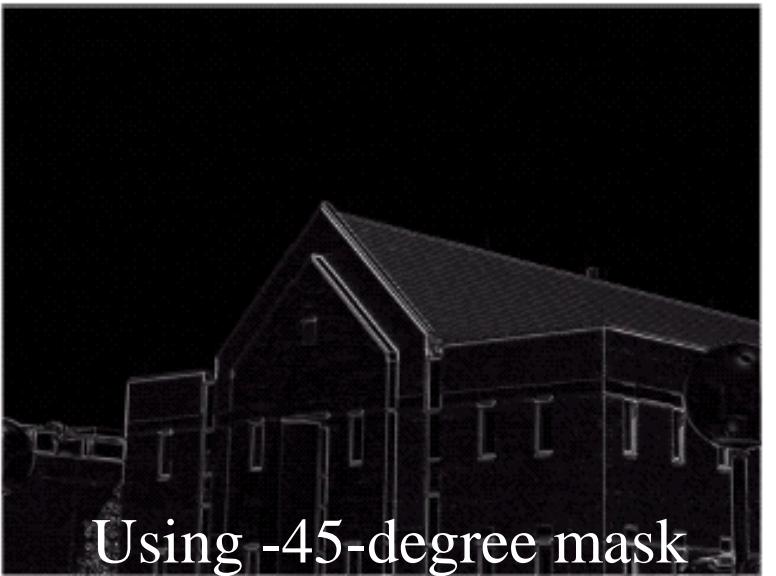

(Images from Rafael C. Gonzalez and Richard E. Wood, Digital Image Processing, 2nd Edition.)

Example of Image Gradient

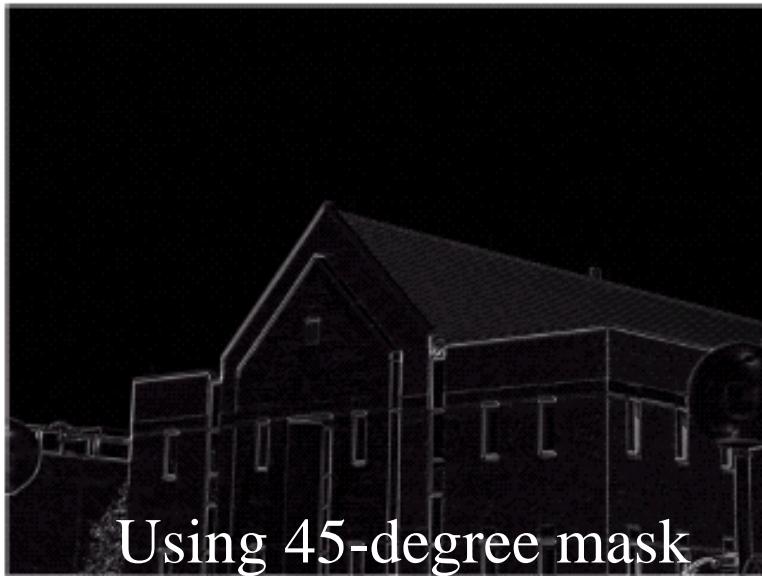

Note: the original image is smoothed by a 5x5 moving average mask first.

Example of Diagonal Edges

Using -45-degree mask

Using 45-degree mask

0	1	2
-1	0	1
-2	-1	0

-2	-1	0
-1	0	1
0	1	2

Sobel

Note: the original image is smoothed by a 5x5 moving average mask first.

Laplacian Masks

The Laplacian masks are used to estimate the Laplacian image:

$$\nabla^2 P = \frac{\partial^2 P}{\partial x^2} + \frac{\partial^2 P}{\partial y^2}$$

Ideally, the Laplacian mask must be directional invariant: symmetry in all direction (radially symmetry). However, for 3x3 masks, there are Only 8 possible directions. Hence, we can use the following masks:

0	-1	0
-1	4	-1
0	-1	0

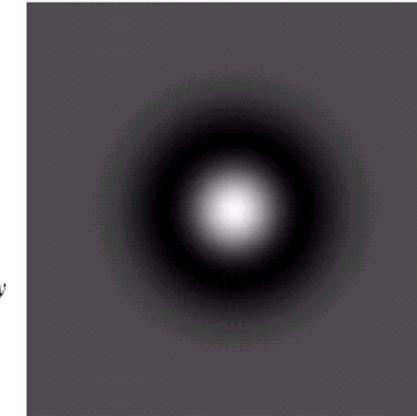

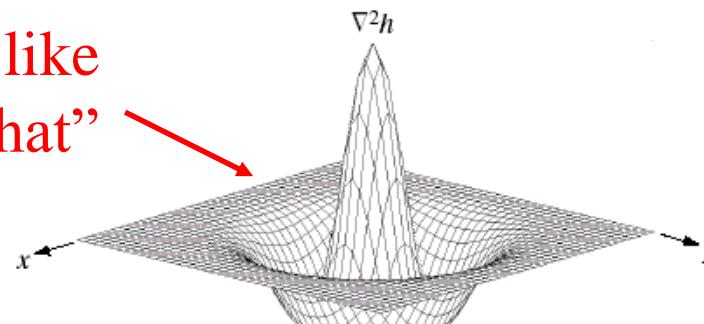

-1	-1	-1
-1	8	-1
-1	-1	-1

Laplacian Masks

For a large scale Laplacian mask, we can use a Laplacian of Gaussian (LOG) as a mask:

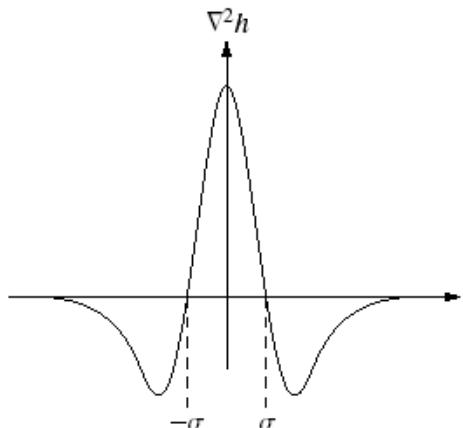

$$\nabla^2 G(x, y) = -\left[\frac{x^2 + y^2 - \sigma^2}{\sigma^4} \right] e^{-\left(\frac{x^2+y^2}{2\sigma^2}\right)}$$

Surface plot of
LOG, Looks like
a “Mexican hat”

LOG image

Cross section
of LOG

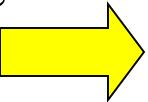

0	0	-1	0	0
0	-1	-2	-1	0
-1	-2	16	-2	-1
0	-1	-2	-1	0
0	0	-1	0	0

5x5 LOG
mask

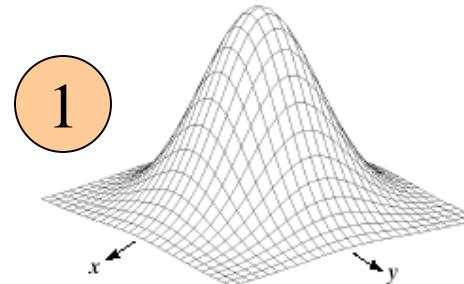

Example of Laplacian Image

The angiogram image
(blood vessels)

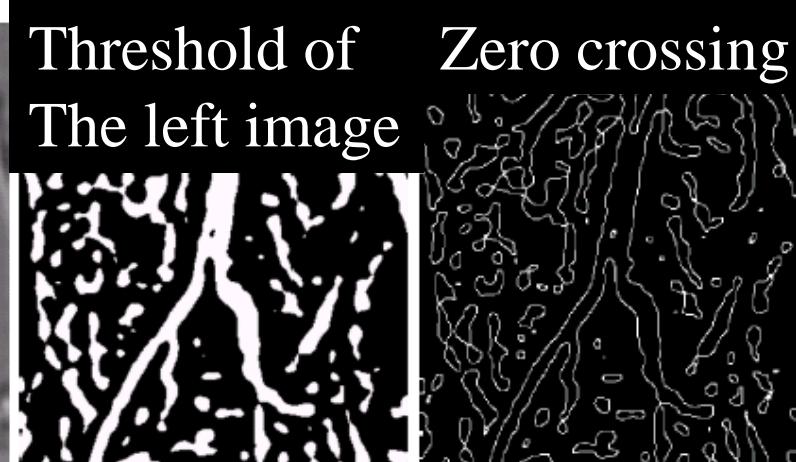

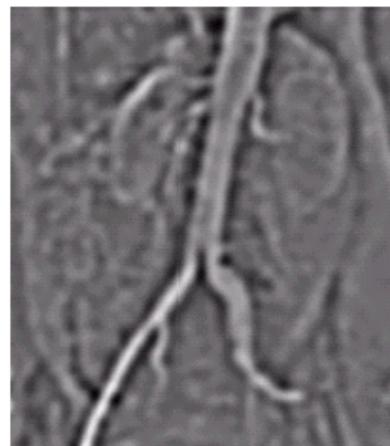

We can compute the
Laplacian image by:

1. Smooth the image
by the Gaussian mask
2. Compute the Laplacian
image using the mask

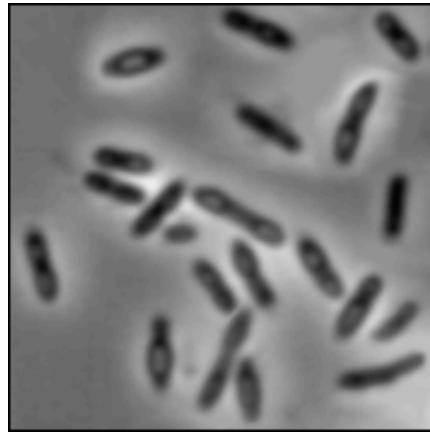

-1	-1	-1
-1	8	-1
-1	-1	-1

$$\nabla^2 G * P$$

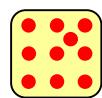

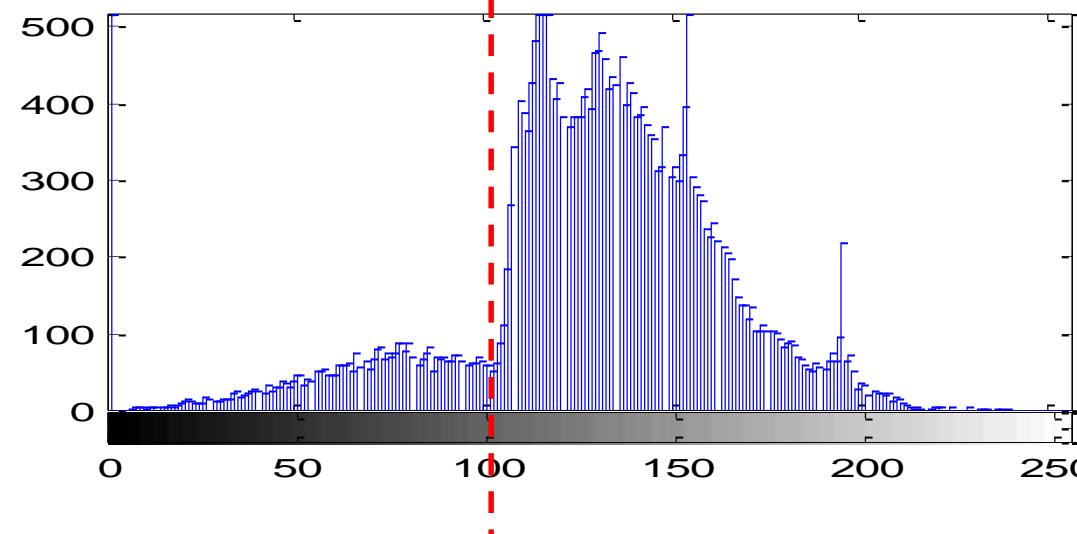

Pixel Oriented Image Segmentation: Thresholding

Intensity Thresholding

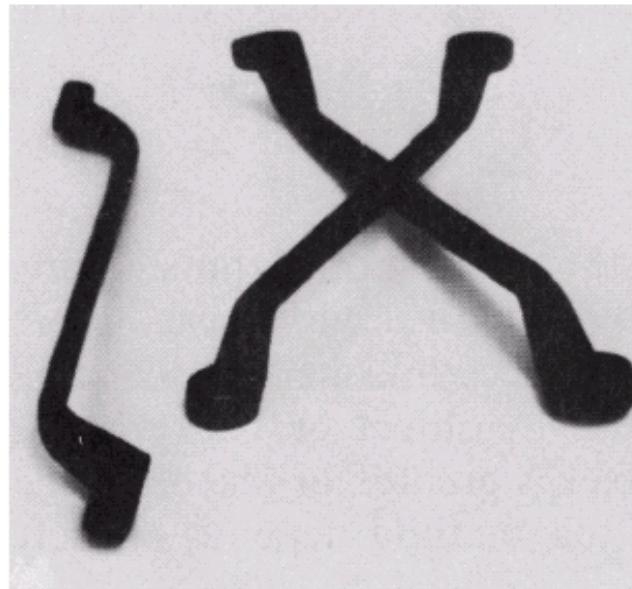

$T = 102$

$$g(x, y) = \begin{cases} 1 & f(x, y) > T \\ 0 & f(x, y) < T \end{cases}$$

After thresholding

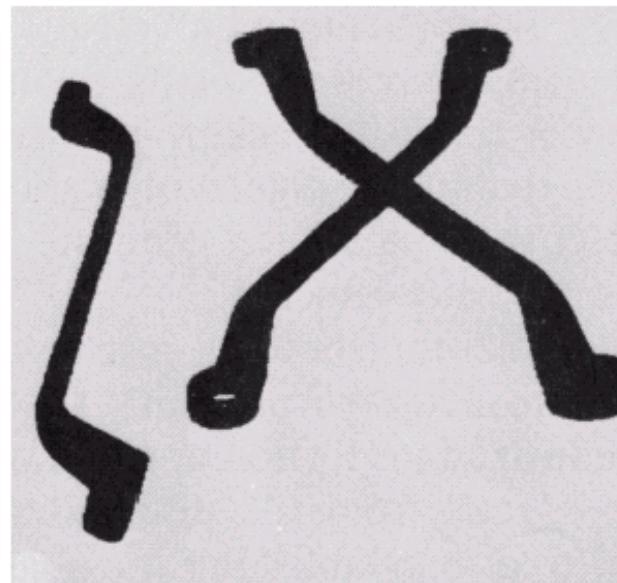

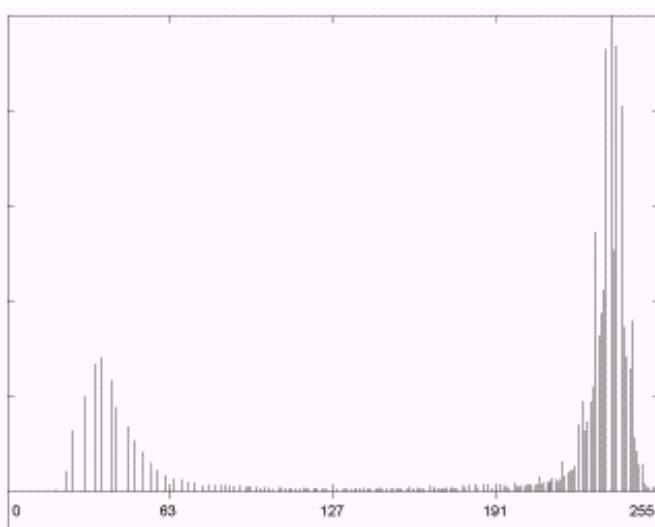

Intensity Thresholding Example

a
b | c

FIGURE 10.28

(a) Original image. (b) Image histogram.
(c) Result of global thresholding with T midway between the maximum and minimum gray levels.

Automatic Threshold Level Selection

The major problem of intensity thresholding is to **find a good threshold level**

Algorithm: effective for bimodal histogram

1. Set initial value of T

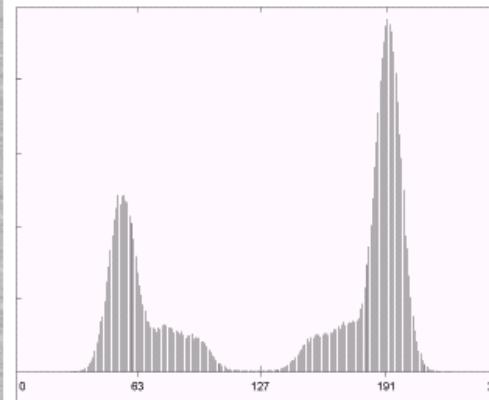

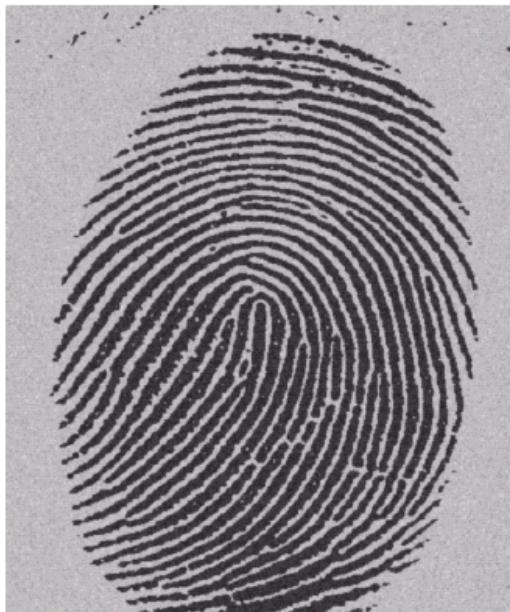

$$2. \quad T_1 = \text{Average}(p(x, y) | p(x, y) > T)$$

$$3. \quad T_2 = \text{Average}(p(x, y) | p(x, y) \leq T)$$

$$4. \quad T = \frac{T_1 + T_2}{2}$$

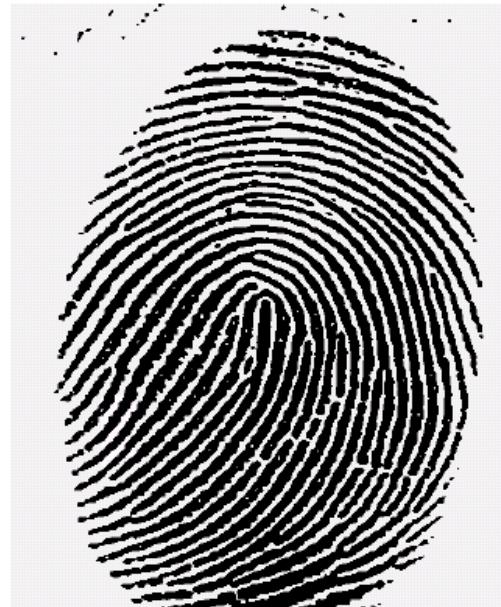

5. Repeat step 2

Automatic Threshold Level Selection Example

Institute of
Standards and
Technology.)

Multilevel Intensity Thresholding

Threshold Level

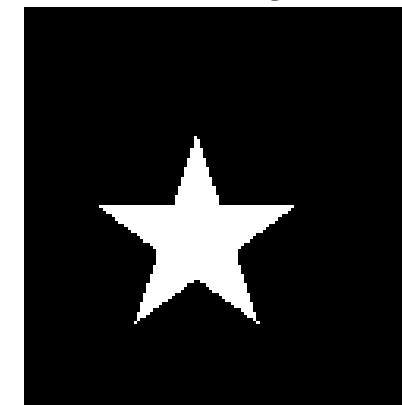

$T_1 < P < T_2$

$T_2 < P < T_3$

$P > T_3$

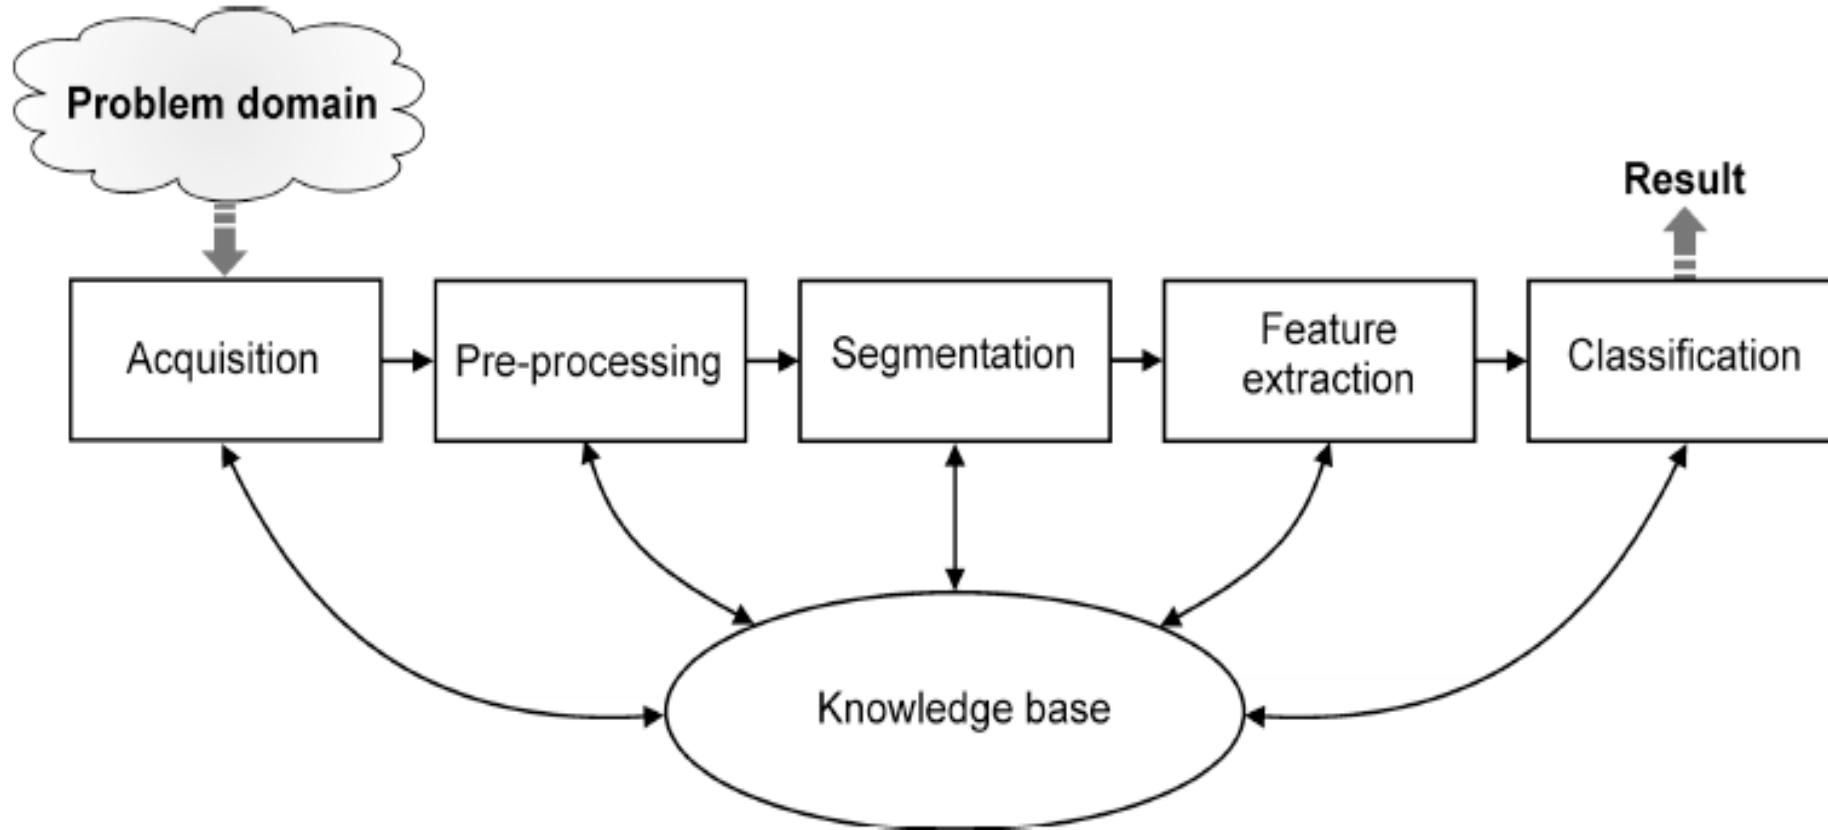

Medical Image Segmentation

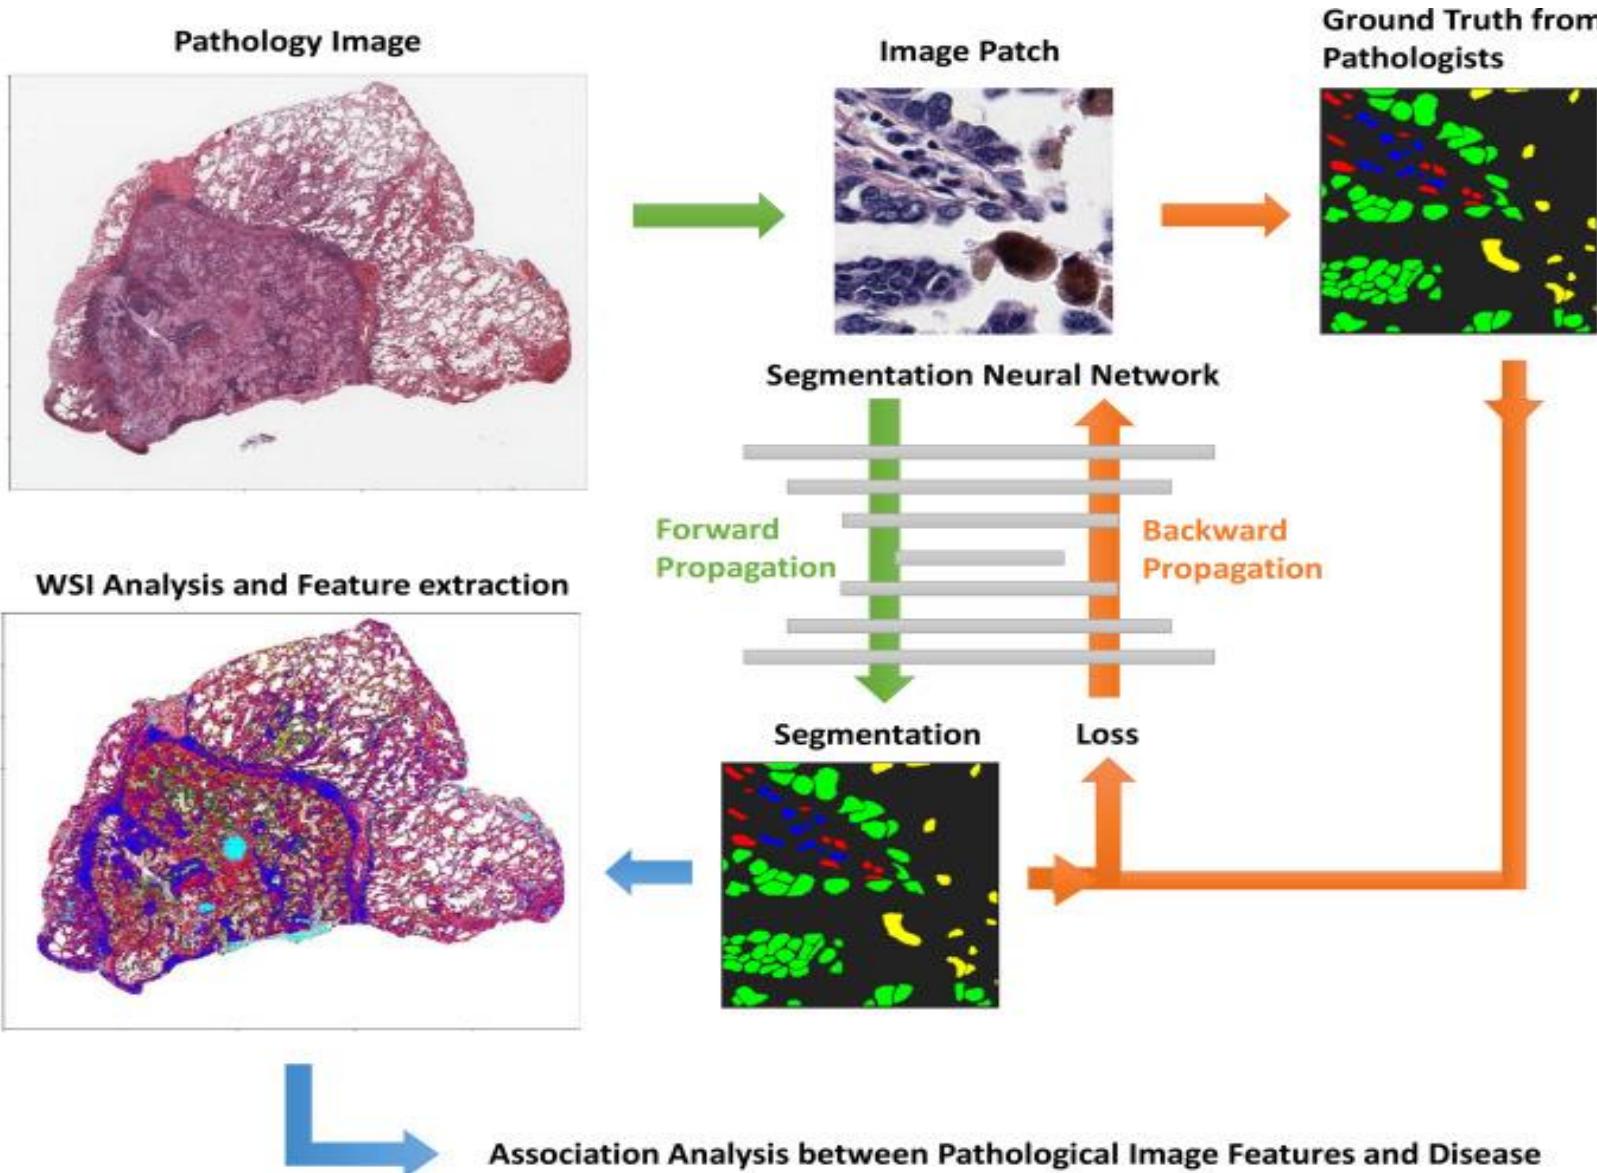

Medical image segmentation is a computer vision task that involves dividing a medical image into multiple segments, where each segment represents a different object or structure of interest in the image. This process is crucial for diagnosis, treatment planning, and quantitative analysis in the medical field. It can be a time-consuming task, but recent advances in artificial intelligence (AI) software techniques are making it easier, allowing for a more precise analysis and the removal of unwanted details from a scan. Various methods, including deep learning, convolutional neural networks, and machine learning algorithms, are being used for medical image segmentation, and they have shown promising results in terms of accuracy and efficiency.

Introduction to Digital Image Segmentation

Machine Vision Systems

Pathology Image Segmentation

Radiology: image segmentation

classification of digital image segmentation algorithms

Digital Image segmentation employs two main approaches:

Similarity Approach:

Method: Detects similarity among image pixels using a specified threshold.

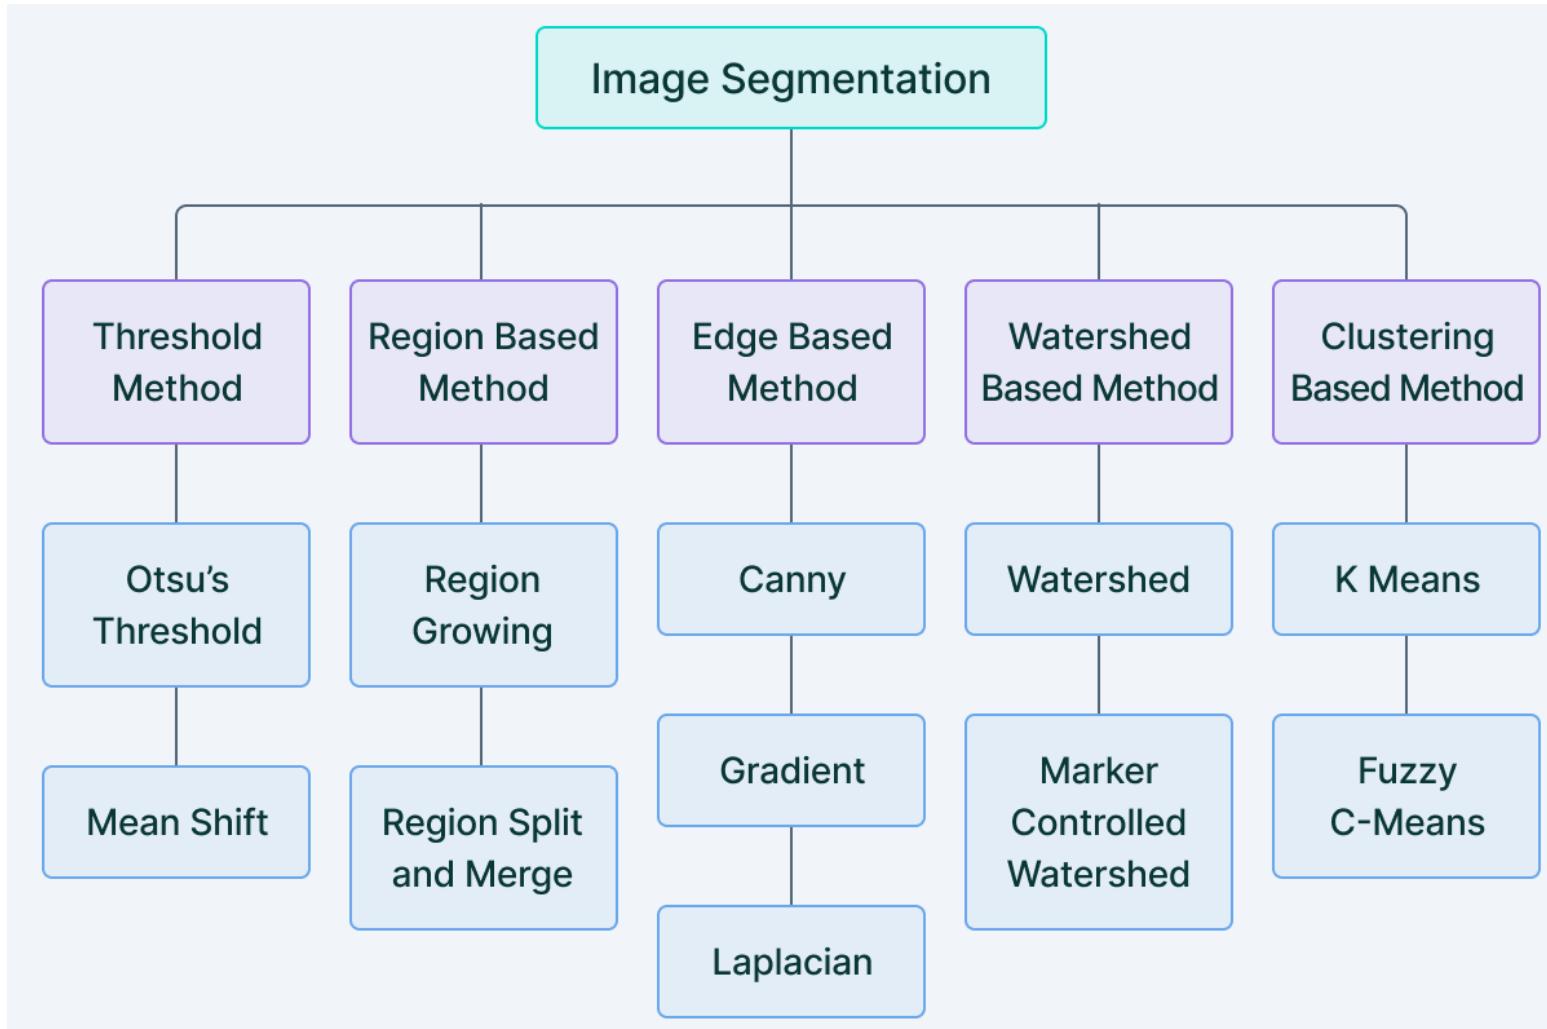

Application: Utilized by machine learning algorithms, such as clustering, to segment images.

Discontinuity Approach:

Method: Relies on the discontinuity in pixel intensity values of the image.

Application: Employed by techniques like line, point, and edge detection, producing intermediate segmentation results for further processing towards the final segmented image.

Image segmentation Techniques

- Threshold-based segmentation
- Edge-based image segmentation
- Region-based image segmentation
- Clustering-based image segmentation
- Artificial neural network-based segmentation

Automatic Image Segmentation

Automatic image segmentation, a key computer vision technique, divides digital images into segments for simplified analysis. Common approaches include:

Threshold-based Segmentation:

Method: Sets a threshold on pixel intensity to create binary or multi-color images.

Advantage: Simplicity.

Region-based Segmentation:

Method: Assigns labels based on pixel similarity to a seed pixel (user-defined).

Types: Region growing and region splitting and merging.

Advantage: User interaction.

Automatic Image Segmentation

Machine Learning-based Segmentation:

Method: Uses algorithms like clustering and deep learning to identify objects and segment images.

Examples: Graph cuts.

Advantage: Automation.

Graphical Energy Minimization Techniques:

Examples: GrabCut, utilizing Gaussian mixture models and graph cuts.

Use: Particularly for interactive segmentation.

Instance Segmentation:

Method: Identifies specific object instances for each pixel.

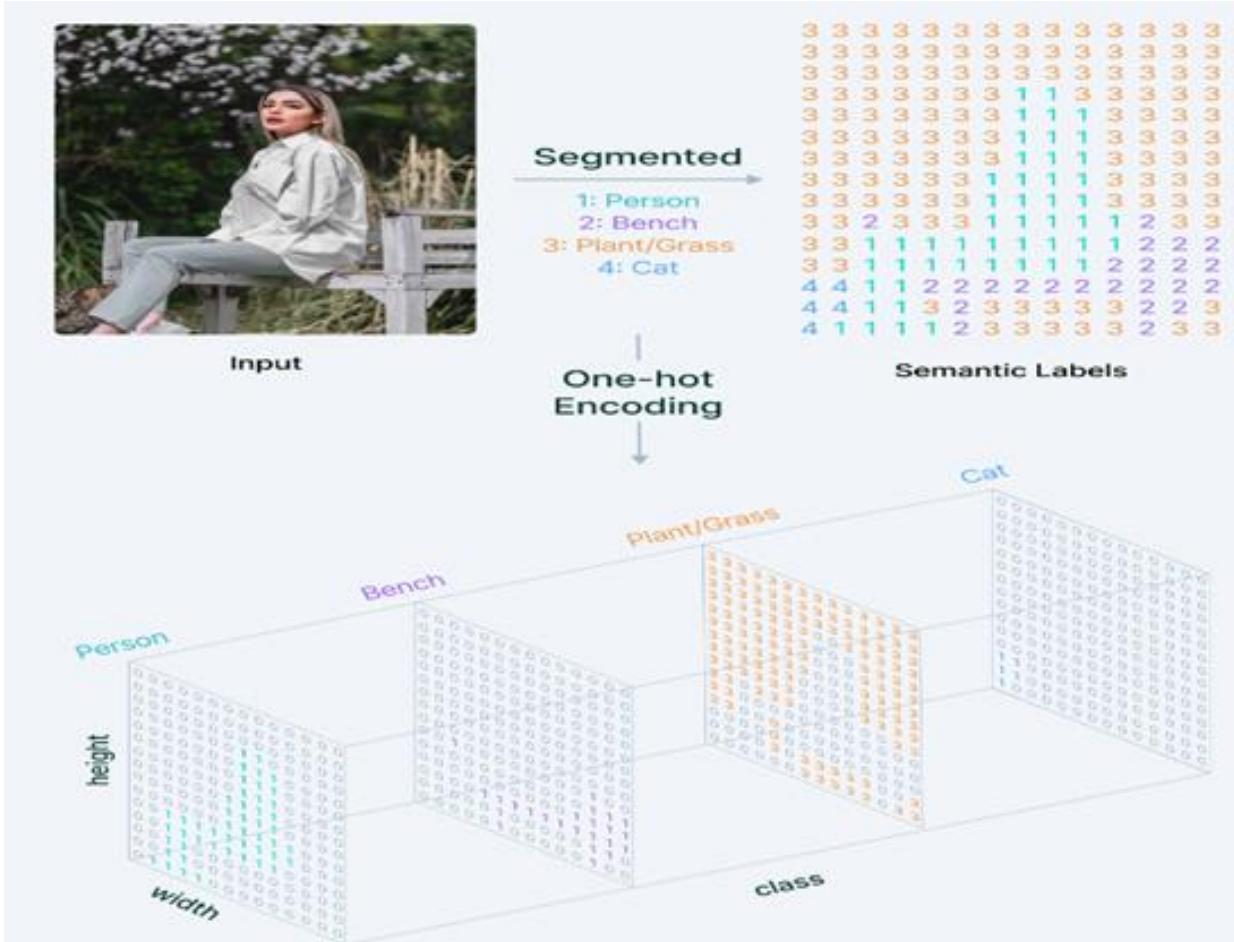

Use: Detects distinct objects of interest in the image.

Deep Learning-based methods

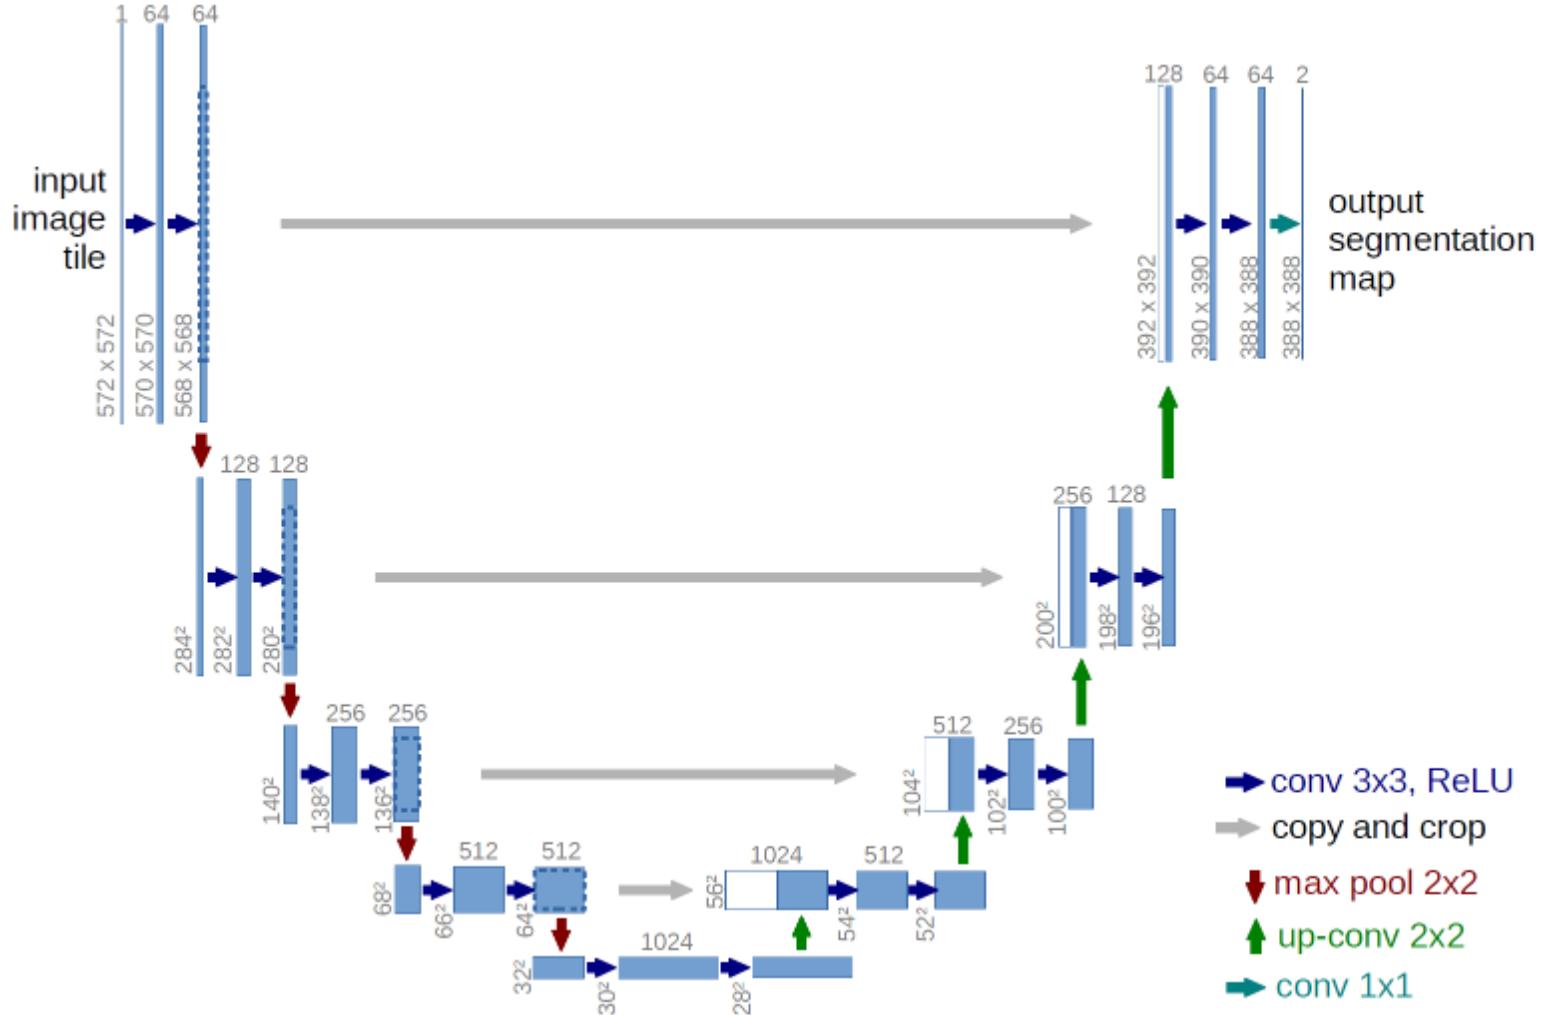

- Semantic segmentation models provide segment maps as outputs corresponding to the inputs they are fed.
- These segment maps are often n-channeled with n being the number of classes the model is supposed to segment. Each of these n-channels is binary in nature with object locations being “filled” with ones and empty regions consisting of zeros. The ground truth map is a single channel integer array the same size as the input and has a range of “n”, with each segment “filled” with the index value of the corresponding classes (classes are indexed from 0 to n-1).

Deep Learning-based methods

Sematic Segmentation

U-Net Segmentation Architecture:

U-Net Segmentation Architecture:

U-Net is a convolutional neural network architecture used for image segmentation, particularly in the biomedical imaging field. It takes an image as input and produces a pixel-wise segmentation map as output. The U-Net architecture consists of an encoder and a decoder. The encoder captures the context in the image through a series of convolutional and max-pooling layers, while the decoder combines the feature maps from the encoder with upsampled feature maps to generate the final segmentation. U-Net was initially developed to detect cell boundaries in biomedical images and has since been widely used in various medical image segmentation tasks due to its effectiveness in capturing fine details and spatial information.

Architecture Overview:

Encoder-Decoder Structure: U-Net has an encoder-decoder setup; encoder captures context, decoder produces segmentation map.

Skip Connections: Connect corresponding layers, preserving fine details during upsampling.

Encoder:

Convolutional Blocks: Series of blocks with convolutional layers, batch normalization, and ReLU activation.

Downsampling: Uses max-pooling or strided convolutions to reduce spatial dimensions.

Decoder:

Upsampling: Employs techniques like transposed convolutions for spatial resolution restoration.

Concatenation: Skip connections concatenate feature maps, aiding in spatial detail recovery.

Skip Connections:

Purpose: Preserve high-res information during encoding and decoding.

Enhancement: Mitigate loss of spatial info during downsampling.

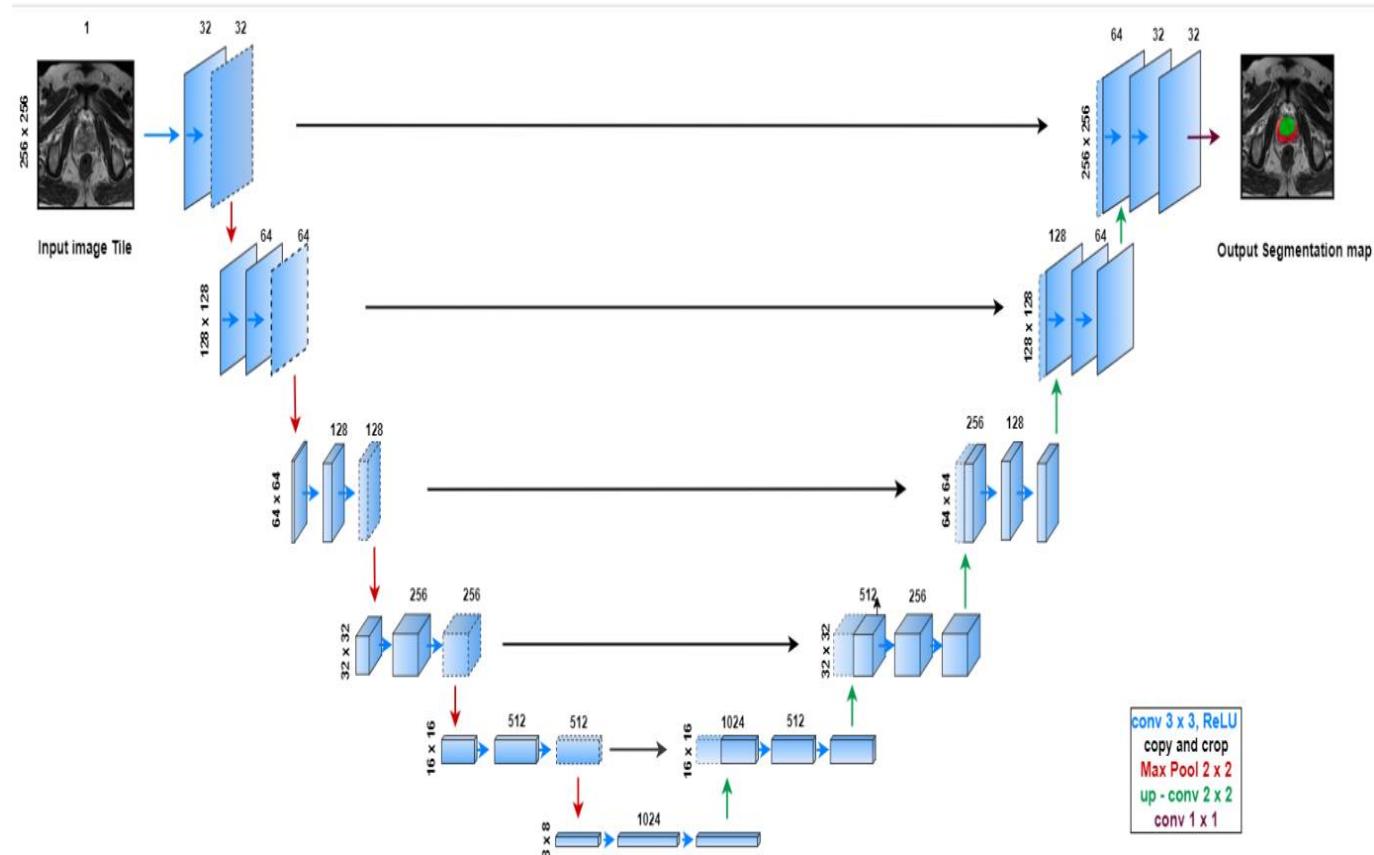

Output Layer:

Activation Function: Final layer often uses softmax for probability maps in segmentation tasks.

Loss Function:

Cross-Entropy Loss: Common choice for image segmentation tasks.
